                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             285

PRO polynucleotides used to produce polypeptides used to target bioactive molecules such as toxins, radiolabels or antibodies, to specific cells, to cause targeted cell death.

Claim 2; Fig 327; 935pp; English

The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF4400 to AAF4470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44200 characteric manna PRO sequences. AAF44087 to AAF44200 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention

New genes and secreted and transmembrane polypeptides (e.g. PRO183 or PRO184), useful for treating or diagnosing e.g. ovarian cancer, Kaposi's sarcoma, leukemia, lymphoma, hepatitis B, multiple sclerosis or Crohn's disease

Claim 1; Fig 327; 663pp; English.

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American Type Culture Collection (e.g. ATCC Deposit No. 209621, 552-PTA, 819-PTA, 209439, 201315, etc); or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, leukaemia or lymphoma,), hepatitis B, multiple sclerosis, or Crohn's disease in mammals. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases.

The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA.

The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This sequence encodes a noyel human secreted and transmembrane PRO polypeptide

GETH ) GENENTECH INC.

New transmembrane polypeptides and polynucleotides useful for chromosome identification, tissue typing, gene therapy, in chromosome and gene mapping, or as molecular weight markers.

Claim 2; Fig 31; 172pp; English.

The invention relates to an isolated nucleic acid encoding a secreted/transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polynucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by culturing the host cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a

heterologous amino acid sequence and an antibody which specifically binds to PRO. The PRO nucleotide sequences are useful as hybridisation probes, in chromosome and gene mapping, in generating sense and antisense RNA or DNA, in generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents, and in gene therapy. The polypeptides may be used as molecular weight markers for protein electrophoresis purposes. The PRO polypeptides and nucleic for protein electrophoresis purposes the PRO polypeptides and nucleic RNO241 (identified as Chordin) is a candidate gene for Cornelia de Lange syndrome. Other PRO proteins are variously implicated in Immune disorders, inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, cardiac injury, book organizations. The present sequence encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          645

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a novel isolated PRO polypeptide. The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This sequence encodes a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MetPhePheGlyGlyGluGlySerLeuThrTyrThrLeuValllelleCysPheLeuThr

used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a nucleic acid sequence of the invention

The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bloactive molecules to cells expressing PRO polypeptides, for modulating collogical activities of cells expressing PRO polypeptides, and for identifying agonists or antagonists. The polynucleotide sequences cromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of RRO polypeptides, for generating transgenic animals or knockout animals, to construct hybridisation probes for mapping the construct hybridisation probes for mapping the construct hybridisation probes for can individuals with genetic disorders, and for the genetic animals of individuals with genetic disorders, and for genetating probes for PCR, construct animalysis, Southern analysis and Western analysis. The present sequence encodes a human PRO polypeptide of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequeta.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes and are therapeutically useful for enhancing immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          226 ATGTTCTTCGGGGGGAGAAGGGAGCTTGACTTACACTTTGGTAATAATTTGCTTCCTGACA

New isolated PRO polypeptide and encoding nucleic acids, useful for the diagnosis and treatment of disorders such as inflammatory disease, atherosclerosis, cardiac injury, infertility, AIDS, cancer and diabetic complications

Claim 2; Fig 31; 171pp; English

The invention relates to an isolated PRO polypeptide having at least 80% amino acid sequence identity to and scoring at least 80% positives when compared to any of 15 fully defined sequences of 235-954 amino acids, given in the specification. Also included are: (1) an isolated PRO circluded are: (1) an isolated PRO control of the specification and enclosed are: (1) an isolated PRO control of comprising any of 15 fully defined nucleotide sequences of 957-3441 bp. Comprising any of 15 fully defined nucleotide sequences of 957-3441 bp. Comprising the Rectar and deposited under ATCC accession number are comprising the PRO nucleic acid; (3) a host cell comprising the vector. Comprising the PRO nucleic acid; (3) a host cell comprising the vector; (4) producing PRO polypeptides, comprising culturing the cell for expression of the PRO polypeptide and recovering the PRO polypeptide from the cell culture; (5) a chimaeric molecule comprising PRO polypeptide and recovering the PRO polypeptide and compression are useful for the diagnosis and treatment of methods and compositions are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS comprised and compositions are useful cancer, diabetic complications and mutations in general. The present sequence is a cDNA encoding a PRO control of the procession of the present sequence is a cDNA encoding and processing the present sequence is a cDNA encoding and processing the present sequence is a cDNA encoding and processing the present sequence is a cDNA encoding and processing the processing the present sequence is a cDNA encoding and the present sequence is a cDNA encoding and the processing the present sequence is a cDNA encoding and the present sequence is a cDNA encoding and the present sequence is a cDNA encoding and the processing the present sequence is a cDNA encoding and the present and the present as the present and the present as the present and th polypeptide

```
therapy. (II) is also useful for generating transgenic animals or knockout animals for the development and screening of therapeutically useful reagents. PRO213 polypeptide is useful for treating inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer and diabetic complications. The other PRO polypeptides including PRO243, PRO323, PRO327, PRO344, PRO347, PRO354, PRO355, PRO15, PRO561 and PRO355, PRO415, PRO541 is useful for treating human disorders involving the immune system. PRO41 is useful for stimulating release of proteoglycans from cartilage, and thus for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. (I) is also useful for inhibiting vascular endothelial cell growth factor (VEGF) stimulated proliferation of endothelial cell growth. This sequence encodes a novel human secreted and transmembrane protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CTAAGGCTGTCTGCTAGTCAGAATTGCCTCAAAAAGGGTCTAGAAGAGTGTTGTCATTGAC 345

The invention discusses isolated two secreted transmembrane polypetities comprising a sequence without signal peptide and the mucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. tumours in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits as targets for therapeutic intervention in certain cancers (e.g. colon, lung or breast cancers) and diagnostic determination of the presence of these cancers. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes are useful as hybridisation probes or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX79290-ABX79675 are the genes encoding, the primers presented in ABX79290-ABX79675 are the genes encoding, the primers propes detecting the PRO polynucleotides of the invention. Note: The sequence date for this patent is also available in clearing format from USPTO at sequata.uspto.gov/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses isolated PRO secreted/transmembrane polypeptides

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
